The smart way to save

You're wasting water. Like every other business or public sector organisation, you have hidden opportunities to reduce consumption – and save money. To do so, you need to take a close look at the way you currently use water. That means monitoring at key points, then acting on the results. Which is where our clever smart meters can help.

At Business Stream, we put the latest innovative technology to work on your site. Then, using our expert knowledge and experience, we analyse the data to uncover any problems or discrepancies – and work with you to resolve them. So far, more than 60 companies have taken advantage of our smart metering service – and all of them are already reaping the savings.

Your spies on the ground

Smart meters provide constant surveillance. They can be installed over several sites, or just one.

Before installation, we'll work with you to understand your operation. We'll identify the locations with the greatest potential for savings as the most useful points to begin monitoring.

Each smart meter takes a meter read every 15 minutes. Using our secure website, you'll be able to see the reads mapped clearly out on a 'day plus one' basis – whether you want full data, or at-a-glance graphic summaries.

Making sense of it all

Smart technology alone isn't enough. Our water experts will sift your data regularly to analyse consumption and spot significant patterns.

They'll be able to track flow patterns and trends in demand. What they come up with might help you identify wastage or bursts, and optimise your water use.

Depending on your needs, we can compare consumption across different sites or benchmark your efficiency against that of similar organisations.

Bringing home the benefits

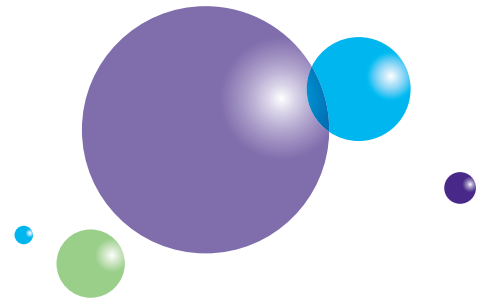

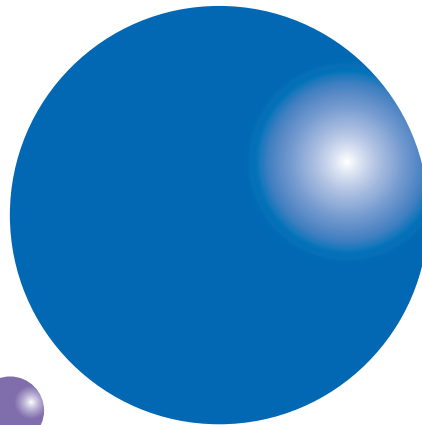

Once they've analysed the data gathered, our experts will come up with firm recommendations – then help you put them into practice.

An obvious starting point is to identify any leaks or faulty valves. Whether they need a fast repair or a full mains renewal, we can put them right.

In other cases, the data can bring to light poor practices that have gone unquestioned. We may be able to advise you on changing the working culture or on devices you could install in key areas to curb wastage.

In the longer term, we'll go on tracking your consumption. If there's a new leak or burst in the future, we can help you fix it before it starts costing you money.

Watch... understand... save. It's simple when you make use of our technology and know-how.
